Abstract

**Context:** Antioxidants are helpful in increasing the blood circulation and thus help in hair growth as well as in the treatment of diseases. Alopecia is a dermatological disorder with psychosocial implications on patients with hair loss. The antioxidant property of plant and different herbs can be utilized in hair fall conditions or many diseases.

**Aim:** The aim of this study is to develop an herbal hair growth promoting shampoo using *Piper betle* and *Psidium guajava* leaves extract due to their antioxidant property.

**Materials and Methods:** Antioxidant activity of herbal shampoo formulation containing *P. betle* and *P. guajava* leaves extract was determined using 2, 2-diphenyl-1-picrylhydrazyl (DPPH) method, 0.5 ml of each sample at various concentrations was added to 1.5 ml of DPPH (0.004%) solution and allowed to stand in the dark at room temperature for 20 min. The absorbance at 520 nm was recorded using UV spectroscopy which was compared with ascorbic acid taken as standard.

**Results:** The results of the study demonstrated that formulation FC3 exhibited best antioxidant activity and formulation was stable for 2 months. The formulation FC3 shows better pH, foamability, dirt dispersion, and wettability.

**Conclusion:** The results of this study suggested that herbal shampoo formulation containing *P. betle* and *P. guajava* leaves extract is best for hair growth promoter and many problems related to hairs.

**Key words:** Antioxidants, hair fall, hair, herbal shampoo, *Piper betle*, *Psidium guajava* L.

INTRODUCTION

**Hair**

Hair is one of the vital parts of the body derived from ectoderm of the skin, is protective appendages on the body. They are also known as epidermal derivatives as they originate from the epidermis during embryological development.[1] Hair is a protein filament that grows from follicles found in the dermis.[2]

**Hair Fall**

Hair fall is the thinning of hair on the scalp. The medical term for hair fall is alopecia. Alopecia can be temporary or permanent.[3] Hair fall is one of the most common complaints among all patients.[4] Hair fall occurs due to following reasons such as physical stress, poor diet, especially less protein intake, excessive hair styling and coloring, taking excessive amounts of Vitamin A supplements, and Vitamin B deficiency.[5] There are various types of hair growth promoters which help in not only reducing the hair fall conditions but also promotes the new growth of hairs, for example, *Emblica officinalis* (amla), *Bacopa monnieri* (brahmi), *Ocimum sanctum* (tulsi), and *Nerium oleander* (kaner).[6]

**Herbal Shampoo**

Natural cosmetics are popular one all over the world as they convey the impression of having better purity, safety, and...
Herbal shampoo is a cosmetic preparation which uses herbs from plants and it is meant for washing of hair and scalp just like a regular shampoo. Herbalists, today, believe in helping people intended for build their good health with the help of natural sources.

**Antioxidants**

Antioxidants are the substances that are used in small concentration and thus inhibit the process of oxidation. The physiological role of antioxidants is to prevent damage of cellular components arising as a consequence of chemical reactions involving free radicals.

**Role of Antioxidants in Hair**

Antioxidants have been included in cosmetic formulations specially designed to reduce the adverse effects on hair fiber. Antioxidants are extremely beneficial in the prevention of hair loss as well as stimulating new, healthy hair growth. Some of the most powerful ones are green tea, blueberries, and grape seed extract.

*Piper betle* belongs to the family Piperaceae. The betel plant is an evergreen and perennial creeper, with glossy heart-shaped leaves. Betel leaves for hair loss are powerful because the content of polyphenols and flavonoids in betel leaf serves as an antioxidant and anti-inflammatory that can protect the hair from broken which is caused by inflammation of skin diseases and free radicals that cause hair loss on the head.

*Psidium guajava* L. is a small medicinal tree that is inhabitant to South America. It is popularly known as guava (family: Myrtaceae). Guava leaves strengthen the hair follicles, which promote thicker, stronger, shinier, and healthier hair growth. Guava leaves contain Vitamin C, which helps boost collagen activity. This helps hair grow out faster and healthier. Both betel and guava leaves are best known for hair growth promotes and their formulation is not prepared at all. Hence, the aim of this research article was to formulate a herbal shampoo for hair growth promoter containing betel and guava leaves extract.

**MATERIALS AND METHODS**

**Collection of Plant Materials**

Betel leaves were purchased from the local market of Ratlam and guava leaves were collected from local region and both leaves were authenticated by Dr. S. N. Mishra (Head AINP on M and AP) KNK College of Horticulture, Mandsaur, M.P.

**Extraction Method**

**Extraction of betel leaves using distilled water as a Solvent**

Betel leaves were extracted using water as a solvent. The extraction was carried out using heating mantle and beaker of 1000 ml. Leaves were dried under shade and dried powder of leaves was used for extraction. About 30 g of powdered leaves were boiled with 900 ml of water at 50°C to avoid degradation of phytochemical for 9 h; extract was filtered through a muslin cloth and then dried by heating in water bath.

**Extraction of guava leaves using distilled water as a solvent**

Guava leaves were extracted using water as a solvent. The extraction was carried out using heating mantle and beaker of 1000 ml. Leaves were dried under shade and dried powder of leaves was used for extraction sample of 50 g guava leaves in 1 L distilled water was boiled for 4 h at 100°C. The sample was then filtered using muslin cloth and dried by heating in water bath [Figure 1].

**Procedure of Herbal Shampoo**

Mix water, oleic acid, and sodium lauryl sulfate and heat to 60°C. Slowly add triethanolamine with continuous stirring. Add EDTA and methylparaben, after cooling to 35°C and finally add two drops of lavender oil for imparting fragrance in shampoo preparation [Table 1 and Figure 2].

**Antioxidant Activity of Formulated Shampoo Preparation**

The antioxidant activity of the formulation was examined on the basis of the scavenging effect and hydrogen donating

![Figure 1: Extract of betel and guava leaves](image1)

![Figure 2: Formulated herbal shampoo containing betel leaves and guava leaves extract](image2)
ability on the stable 2, 2-diphenyl-1-picrylhydrazyl (DPPH) free radical and the absorbance was taken at 520 nm using UV spectrophotometer.

**Procedure of Sample Preparation**

About 10 mg/ml of shampoo formulation were weighed and prepared a sample solution using ethanol as a solvent and then filtered it and volume was makeup up to 10 ml in volumetric flask. 0.5 ml of each sample at various concentrations was added to 1.5 ml DPPH (0.004%) solution and allowed to stand in the dark at room temperature for 20 min. The absorbance at 520 nm was recorded using UV spectroscopy and results are expressed in ascorbic acid equivalent/g dry weight of sample. The percentage of inhibition of DPPH free radical scavenging activity was calculated using the following equation:

\[
\% \text{ inhibition} = \left( \frac{A_{\text{DPPH}} - A_{\text{Sample}}}{A_{\text{DPPH}}} \right) \times 100
\]

Where,

\( A_{\text{DPPH}} \) = Absorbance of DPPH

\( A_{\text{Sample}} \) = Absorbance of sample (extract/ascorbic acid).

**Preparation of Standard (Ascorbic Acid)**

About 10 mg/ml of ascorbic acid was prepared in ethanol; then, 5 ml of sample were taken and volume was makeup up to 50 ml and different dilutions of different concentrations were prepared from this stock solution, that is, 20 μg/ml, 40 μg/ml, 60 μg/ml, 80 μg/ml, and 100 μg/ml.

**Evaluation Parameters of Shampoo**

**Physical appearance**

Formulation prepared was evaluated for the clarity, color, odor, and foam producing ability.

**Determination of pH**

The pH of 5% v/v shampoo solution in distilled water was measured using pH meter at room temperature or at 45°C temperature.[25]

**Dirt dispersion**

Two drops of shampoo were added in a large test tube contain 10 ml of distilled water. One drop of India ink was added; the test tube was stoppered and shakes it 10 times. The amount of ink in the foam was estimated as none, light, moderate, or heavy.[26]

**Foaming ability and foam stability**

Cylinder shake method was used for determining foaming ability. 50 ml of the 1% shampoo solution was put into a 100 ml graduated cylinder and covered the cylinder with hand and shaken for 10 times. The total volumes of the foam contents after 1 min shaking were recorded. The foam volume was calculated only. Immediately after shaking the volume of foam at 1 min intervals for 4 min was recorded.[27]

**Stability study**

The stability study was carried out for the prepared shampoo at standard room temperature of 25–45°C for 2 months.[28]

**RESULTS AND DISCUSSION**

**Antioxidant Activity**

Antioxidant activity of the shampoo formulation was determined using DPPH method. The percentage inhibition was calculated in herbal formulation which contains betel leaves and guava leaves extract in combination of different concentrations FC₁ (1:3) that contains betel leaves:guava leaves), FC₂ (2:2) (betel leaves:guava leaves), and FC₃ (3:1) (betel leaves:guava leaves) formulations were showed 66%, 72%, and 88% inhibition, respectively, as compared to ascorbic acid which was taken as standard of different concentrations (20 μg/ml, 40 μg/ml, 60 μg/ml, 80 μg/ml, and 100 μg/ml) that show 48%, 62%, 69%, 76%, and 79% inhibition. From this percentage inhibition, combination formulation of FC₃ shows better inhibition [Graphs 1 and 2].

**Graph 1:** 2, 2-diphenyl-1-picrylhydrazyl scavenging activity of shampoo formulation
**Evaluation Parameters of Herbal Shampoo**

**Physical properties**

Physical properties of combination formulation FC₃ are shown in Table 2.

**Stability studies**

All the physicochemical parameters were well maintained during the period of accelerated stability studies at temperatures 4°C in refrigerator and at 25°C and 45°C in incubator for 2 months. Formulation FC₃ shows good stability in color, odor, foamability, and consistency until the end of accelerated study [Table 3].

**CONCLUSION**

At present, time herbal cosmetic has been marked up in personal care system and there is a great requirement for the herbal cosmetics in daily life. In this research article, formulate an herbal anti-hair fall and hair growth promoting shampoo containing betel leaves and guava leaves extract. Formulation was prepared containing betel leaves and guava leaves extract of different concentrations in combination and antioxidant activity was determined by taking ascorbic acid as standard. The percentage inhibition of a combination formulation FC₃ shows 88% as compared to ascorbic acid which shows 79% inhibition of DPPH and formulation was evaluated for general parameters such as pH, dirt dispersions, and appearance and it was stable for 2 months and it is best for the hair fall conditions, alopecia, because betel leaves and guava leaves are best for reducing hair fall or hair growth promoter and show best antioxidant activity and their combination formulation is not available in the market at now. A need for this age is to prepare herbal cosmetics which will prove beneficial and has lesser side effects.
